[FULL NAME]

FULLSTACK / BACKEND DEVELOPER

[Phone Number] | [Email Address]
Vietnam | [GitLab / Portfolio Link]

TECHNICAL SKILLS

Frontend: React, Next.js, TailwindCSS, PUG, HTML5, CSS3, JavaScript

Backend: Node.js, Express.js, TypeScript, RESTful API

Database & Auth: MongoDB, Mongoose, Aggregation Pipeline · JWT, bcryptjs

Others & Libraries: Cloudinary, ZaloPay API, VNPay API, Joi, Git, Postman, Zustand, TanStack Query

Soft Skills: Proactive in learning and willing to adapt to new technologies and knowledge based on job requirements.

PERSONAL PROJECTS

1. IT Job Recruitment Website

Role: Solo Developer | [Source Code Available]

Tech stack: TypeScript, Express.js, Next.js, React, TailwindCSS, MongoDB, Cloudinary

- **Authentication:** Implemented 2 distinct roles (Candidate, Employer) with Access Token (15 min) + Refresh Token (7 days), stored securely in HttpOnly Cookie with auto-refresh on expiry.
- **Job Search & Filtering:** Built multi-criteria search supporting 6 simultaneous filters (language, city, company, keyword, level, work type) with efficient server-side pagination.
- **Query Optimization:** Utilized MongoDB Aggregation Pipeline with `$lookup` to join Jobs + Company + City data in 1 single query instead of 3 sequential roundtrips.
- **Complete CV Submission Flow:** Managed end-to-end applicant tracking: candidate applies (duplicate check) → employer views list and approves/rejects → candidate tracks CV status in real time.
- **Architecture:** Designed backend using clean 3-layer architecture (Controller → Service → Repository) with centralized error handling via Global Error Middleware.
- **Validation & UI:** Centralized input validation using Joi with dedicated schema per API; built pixel-accurate, fully responsive user interface matching Figma design specifications.

2. Tour Booking Website

Role: Solo Developer | [Source Code & Demo Available]

Tech stack: JavaScript, Express.js, PUG, CSS, MongoDB, ZaloPay API, VNPay API, Nodemailer

- **Payment Integration:** Integrated 2 online payment gateways: ZaloPay (HMAC-SHA256) and VNPay (HMAC-SHA512) to create transactions, handle redirects, verify webhooks/callbacks, and auto-update order status.
- **Dynamic RBAC:** Created role groups with fine-grained granular permissions (tour-create, tour-edit, tour-delete, ...), assigned roles to accounts, and enforced permission verification via dedicated middleware.
- **Security & OTP Flow:** Built forgot password flow via email OTP: generated numeric OTP, dispatched via Nodemailer, configured auto-expiration after 5 minutes using MongoDB TTL indexing.
- **Tour Management:** Full CRUD operations, managed dynamic price/stock tiers for 3 customer classes, soft delete with trash + restore and permanent purge capabilities.
- **Booking Flow:** End-to-end cart flow generating order codes, auto-deducting tour stock, selecting payment methods, and managing order state machine (pending / completed / cancelled).
- **Front-end Implementation:** Built UI from Figma designs, ensuring measured pixel-accurate dimensions and responsive layout implementation.
